

STEFAN WÜLSER

Stefan Wülser is an architect who proficiently deals with the cultural and political implications of design and building projects on different scales and in different constellations. He questions both the way spaces are programmed and the processes of their production and construction. The open-ended work puts everything up for debate: from a-priori quality features such as specificity and permanence to the question of a contemporary and responsible approach to luxury. With a radical focus on the future, the young zurich-based office develops projects that do not seek sustainability through renunciation, but through an unconditional confrontation with the conditions of the present.

H190GRID

The H190GRID sideboards, desks, shelves, walls make use of a series of techniques that we tested and applied in the most diverse scales of our work. // 1 the typical connections of the light shaft grids use clamps and interlocks to connect materials non-destructively, contrary to their actual purpose, these are not used for mounting on external parts, but for connecting several grids. // 2 the construct uses only one part that is not generically available from the catalogue: in this case, the locally cnc-cut mdf boards. their use multiplies the performance of all the other materials found. // 3 due to the clear structure, which distributes tensile and compressive forces neatly among the materials used, there is hardly any material ageing caused by stress. galvanised threaded rods pull the grates together. the mdf boards placed in between absorb the pressure and create a rigid whole.

the parts used are all easily available as found objects or generic catalogue goods and are only nobilised by the specifically cut mdf parts. these in turn can be created locally by any digitally equipped carpenter without preparation - a service found within 1000m in any large city.

Used materials for a triple shelf / table combination:
galvanised light shaft grids + galvanised safety clamps + galvanised grid connectors + galvanised M8 threaded bars + M8 nuts + custom mdf-boards
